Statistical Natural Language Processing

Recurrent and convolutional networks

Çağrı Çöltekin

University of Tübingen Seminar für Sprachwissenschaft

Summer Semester 2019

Why deep networks?

- We saw that a neural network with a single hidden layer is a universal approximator
- However, this is a theoretical result it is not clear how many units one may need for the approximation
- Successive layer may learn different representations
- · Deeper architectures have been found to be useful in many

Summer Semester 2019 2 / 27

Deep ANNs RNNs CNNs

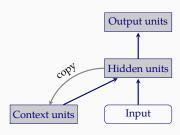

Recurrent neural networks

- Feed forward networks
 - can only learn associations
 - do not have memory of earlier inputs: they cannot handle
- Recurrent neural networks are ANN solution for sequence learning
- This is achieved by recursive loops in the network

Ç. Çöltekin, SfS / University of Tübingen

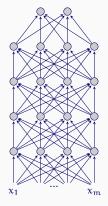

Deep ANNs RNNs CNNs

A simple version: SRNs Elman (1990)

- The network keeps previous hidden states (context units)
- The rest is just like a feed-forward network
- Training is simple, but cannot learn long-distance dependencies

Deep neural networks

- Deep neural networks (>2 hidden layers) have recently been successful in many tasks
- They often use sparse connectivity and shared weights
- We will focus on two important architectures: recurrent and convolutional networks

C. Cöltekin, SfS / University of Tübinger

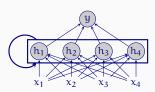

Why now?

- Increased computational power, especially advances in graphical processing unit (GPU) hardware
- · Availability of large amounts of data
 - mainly unlabeled data (more on this later)
 - but also labeled data through 'crowd sourcing' and other
- Some new developments in theory and applications

Ç. Çöltekin, SfS / University of Tübingen

Summer Semester 2019 3 / 27

Recurrent neural networks

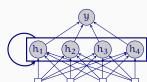

- Recurrent neural networks are similar to the standard feed-forward networks
- They include loops that use previous output (of the hidden layers) as well as the input
- Forward calculation is straightforward, learning becomes somewhat tricky

Ç. Çöltekin, SfS / University of Tübingen

Deep ANNs RNNs CNNs

Processing sequences with RNNs

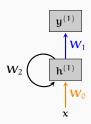

- RNNs process sequences one unit at a time
- The earlier input affects the output through the recurrent links

Ç. Çöltekin, SfS / University of Tübinger C. Cöltekin. SfS / University of Tübingen Summer Semester 2019 6 / 27 Summer Semester 2019

Unrolling a recurrent network Back propagation through time (BPTT)

Learning in recurrent networks

- · We need to learn three sets of weights: W_0 , W_1 and W_2
- Backpropagation in RNNs are at first not that obvious
- The main difficulty is in propagating the error through the recurrent connections

h(0) h⁽¹⁾ h(t)

y^(t-1)

 $\mathbf{x}^{(t-1)}$

 $\mathbf{x}^{(t-1)}$

Note: the weights with the same color are shared.

Unstable gradients

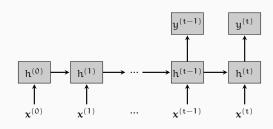

- A common problem in deep networks is unstable gradients
- The patial derivatives with respect to weights in the early layers calculated using the chain rule
- A long chain of multiplications may result in
 - vanishing gradients if the values are in range (-1, 1)
 - *exploding gradients* if absolute values larger than 1
- A practical solution for exploding gradients is called gradient clipping
- $\bullet\,$ Solution to vanishing gradients is more involved (coming

Deep ANNs RNNs CNNs

Unstable gradients revisited

- We noted earlier that the gradients may vanish or explode during backpropagation in deep networks
- This is especially problematic for RNNs since the effective dept of the network can be extremely large
- Although RNNs can theoretically learn long-distance dependencies, this is affected by unstable gradients problem
- The most popular solution is to use *gated* recurrent networks

Deep ANNs RNNs CNNs

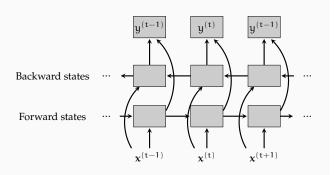

RNN architectures

Many-to-one (e.g., document classification)

Deep ANNs RNNs CNNs

Bidirectional RNNs

processing applications

neighboring units Some weights are shared

- CNNs are not fully connected

Convolutional networks

Gated recurrent networks

- Most modern RNN architectures are 'gated'
- . The main idea is learning a mask that controls what to remember (or forget) from previous hidden layers
- Two popular architectures are
 - Long short term memory (LSTM) networks (above)
 - Gated recurrent units (GRU)

CNNs are also computationally less expensive compared to fully connected networks

• A CNN learns features that are location invariant

• Convolutional networks are particularly popular in image

 $\bullet\,$ They have also been used with success some NLP tasks • Unlike feed-forward networks we have discussed so far,

The hidden layer(s) receive input from only a set of

Deep ANNs RNNs CNNs

Deep ANNs RNNs CNNs Convolution in image processing

- · Convolution is a common operation in image processing for effects like edge detection, blurring, sharpening, ...
- The idea is to transform each pixel with a function of the local neighborhood

Ç. Çöltekin, SfS / University of Tübingen

Example convolutions

Blurring

$$\frac{1}{16} \begin{bmatrix} 1 & 2 & 1 \\ 2 & 4 & 2 \\ 1 & 2 & 1 \end{bmatrix}$$

• Edge detection

$$\begin{bmatrix} -1 & -1 & -1 \\ -1 & 8 & -1 \\ -1 & -1 & -1 \end{bmatrix}$$

Ç. Çöltekin, SfS / University of Tübingen

Deep ANNs RNNs CNNs

Learning convolutions

- Some filters produce features that are useful for classification (e.g., of images, or sentences)
- In machine learning we want to learn the convolutions
- Typically, we learn multiple convolutions, each resulting in a different feature map
- · Repeated application of convolutions allow learning higher level features
- The last layer is typically a standard fully-connected classifier

Ç. Çöltekin, SfS / University of Tübingen

Convolution in neural networks

χ1 χ_2 **X**3 **x**5

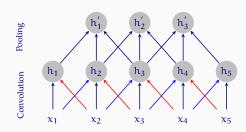

- Each hidden layer corresponds to a local window in the
- · Weights are shared: each convolution detects the same type of features

Ç. Çöltekin, SfS / University of Tübingen

C. Cöltekin, SfS / University of Tübingen

Deep ANNs RNNs CNNs

Pooling

- Convolution is combined with pooling
- Pooling 'layer' simply calculates a statistic (e.g., max) over the convolution layer
- · Location invariance comes from pooling

Deep ANNs RNNs CNNs

Pooling and location invariance

Max pooling Convolution

· Note that the numbers at the pooling layer are stable in comparison to the convolution layer

With successive layers of convolution and pooling, the size of the later layers shrinks • One way to avoid this is padding the input and hidden layers with enough number of

Ç. Çöltekin, SfS / University of Tübingen

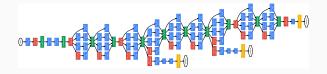

zeros

Padding in CNNs

CNNs: the bigger picture classifier output Fully connected · At each convolution/pooling step, we often want to learn multiple feature maps · After a (long) chain of Pooling hierarchical features maps, the final layer is typically a fully-connected layer (e.g., Convolution softmax for classification)

C. Cöltekin, SfS / University of Tübingen

Real-world examples are complex

really

The real-world ANNs tend to be complex

- Many layers (sometimes with repetition)
- Large amount of branching

An example: sentiment analysis

Ç. Çöltekin, SfS / University of Tübingen

Classifier

Features

Pooling

Feature maps

Convolution Word vectors

CNNs in natural language processing

 $\bullet\,$ The use of CNNs in image applications is rather intiutive

Deep ANNs RNNs CNNs

- the first convolutional layer learns local features, e.g., edges

• In NLP, it is a bit less straight-forward

- CNNs are typically used in combination with word vectors
 The convolutions of different sizes correspond to (word) n-grams of different sizes
- Pooling picks important 'n-grams' as features for classification

Ç. Çöltekin, SfS / University of Tübinger

Summary

· Deep networks use more than one hidden layer

• Common (deep) ANN architectures include:

CNN location invariance

RNN sequence learning
