## Çağrı Çöltekin

University of Tübingen Seminar für Sprachwissenschaft

Summer Semester 2019

## Today's lecture

- Some concepts from linear algebra
- A (very) short refresher on
  - Derivatives: we are interested in maximizing/minimizing (objective) functions (mainly in machine learning)
  - Integrals: mainly for probability theory

This is only a high-level, informal introduction/refresher.

Ç. Çöltekin, SfS / University of Tübingen

Practical matters Overview Linear algebra Derivatives & integrals Summary

# Why study linear algebra?

Consider an application counting words in multiple documents

	the	and	of	to	in	•••
document <sub>1</sub>	121	106	91	83	43	
document <sub>2</sub>	142	136	86	91	69	
document <sub>3</sub>	107	94	41	47	33	
	•••	•••	•••	•••	•••	

You should already be seeing vectors and matrices here.

Ç. Çöltekin, SfS / University of Tübingen

Practical matters Overview Linear algebra Derivatives & integrals Summary

## Vectors

- · A vector is an ordered list of  $numbers\, \boldsymbol{\nu}=(\nu_1,\nu_2,\dots\nu_n)\text{,}$
- The vector of n real numbers is said to be in vector space  $\mathbb{R}^n$   $(\boldsymbol{\nu} \in \mathbb{R}^n)$
- In this course we will only work with vectors in  $\ensuremath{\mathbb{R}}^n$
- Typical notation for vectors:

$$\mathbf{v} = \vec{v} = (v_1, v_2, v_3) = \langle v_1, v_2, v_3 \rangle = \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix}$$

· Vectors are (geometric) objects with a magnitude and a direction

## Some practical remarks (recap)

· Course web page: http://sfs.uni-tuebingen.de/~ccoltekin/courses/snlp

Practical matters Overview Linear algebra Derivatives & integrals Summary

- Please complete Assignment 0
- Assignment 1 will be released next week
- Reminder: there are Easter eggs (in the version presented in the class)

Practical matters Overview Linear algebra Derivatives & integrals Summary

## Linear algebra

Linear algebra is the field of mathematics that studies vectors and

· A vector is an ordered sequence of numbers

$$v = (6, 17)$$

• A matrix is a rectangular arrangement of numbers

$$\mathbf{A} = \begin{bmatrix} 2 & 1 \\ 1 & 4 \end{bmatrix}$$

• A well-known application of linear algebra is solving a set of linear equations

$$\begin{array}{rcl}
2x_1 & + & x_2 & = & 6 \\
x_1 & + & 4x_2 & = & 17
\end{array}$$

 $\begin{bmatrix} 2 & 1 \\ 1 & 4 \end{bmatrix} \times \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} 6 \\ 17 \end{bmatrix}$ 

Ç. Çöltekin, SfS / University of Tübingen

Practical matters Overview Linear algebra Derivatives & integrals Summary

## Why study linear algebra?

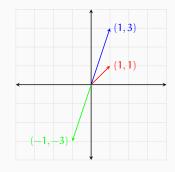

- Insights from linear algebra are helpful in understanding many NLP methods
- In machine learning, we typically represent input, output, parameters as vectors or matrices (or tensors)
- · It makes notation concise and manageable
- In programming, many machine learning libraries make use of vectors and matrices explicitly
- In programming, vector-matrix operations correspond to
- · 'Vectorized' operations may run much faster on GPUs, and on modern CPUs

Ç. Çöltekin, SfS / University of Tübingen

Practical matters Overview Linear algebra Derivatives & integrals Summary

## Geometric interpretation of vectors

- Vectors (in a linear space) are represented with arrows from the origin
- The endpoint of the vector  $\mathbf{v} = (v_1, v_2)$  correspond to the Cartesian coordinates defined by  $v_1, v_2$
- The intuitions often (!) generalize to higher dimensional spaces

C. Cöltekin. SfS / University of Tübingen

C. Cöltekin. SfS / University of Tübingen

## Vector norms

- The *norm* of a vector is an indication of its size (magnitude)
- The norm of a vector is the distance from its tail to its tip
- Norms are related to distance measures
- Vector norms are particularly important for understanding some machine learning techniques

C. Cöltekin, SfS / University of Tübinger

• Euclidean norm, or L2 (or L<sub>2</sub>) norm is the most commonly used norm

 $\|\mathbf{v}\|_2 = \sqrt{\mathbf{v}_1^2 + \mathbf{v}_2^2}$ 

 $\|(3,3)\|_2 = \sqrt{3^2 + 3^2} = \sqrt{18}$ • L2 norm is often written without a subscript:  $\|v\|$ 

• For  $v = (v_1, v_2)$ ,

Practical matters Overview Linear algebra Derivatives & integrals Sum

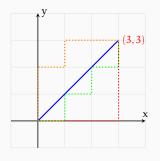

## L1 norm

· Another norm we will often encounter is the L1 norm

$$\|\nu\|_1 = |\nu_1| + |\nu_2|$$

$$||(3,3)||_1 = |3| + |3| = 6$$

• L1 norm is related to Manhattan distance

Ç. Çöltekin, SfS / University of Tübinger

## L<sub>P</sub> norm

L2 norm

In general, LP norm, is defined as

$$\|\mathbf{v}\|_p = \left(\sum_{i=1}^n |v_i|^p\right)^{\frac{1}{p}}$$

Practical matters Overview Linear algebra Derivatives & integrals Sur

We will only work with than L1 and L2 norms, but  $L_0$  and  $L_\infty$ are also common

Ç. Çöltekin, SfS / University of Tübinge

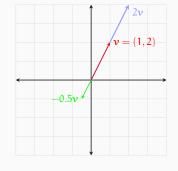

Practical matters Overview Linear algebra Derivatives & integrals

## Multiplying a vector with a scalar

• For a vector  $\mathbf{v} = (v_1, v_2)$ and a scalar a,

$$a\mathbf{v} = (a\mathbf{v}_1, a\mathbf{v}_2)$$

· multiplying with a scalar 'scales' the vector

Ç. Çöltekin, SfS / University of Tübingen

Practical matters Overview Linear algebra Derivatives & integrals Sum

# Vector addition and subtraction

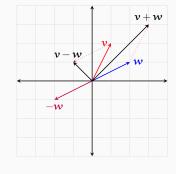

For vectors  $\mathbf{v} = (v_1, v_2)$  and  $w = (w_1, w_2)$ 

• 
$$\mathbf{v} + \mathbf{w} = (v_1 + w_1, v_2 + w_2)$$

$$(1,2) + (2,1) = (3,3)$$

• 
$$\mathbf{v} - \mathbf{w} = \mathbf{v} + (-\mathbf{w})$$

$$(1,2) - (2,1) = (-1,1)$$

Ç. Çöltekin, SfS / University of Tübingen

Practical matters Overview Linear algebra Derivatives & integrals Sun

## Dot (inner) product

• For vectors  $\mathbf{w} = (w_1, w_2)$ and  $v = (v_1, v_2)$ ,

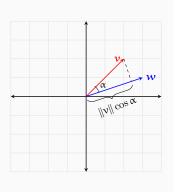

$$wv = w_1v_1 + w_2v_2$$

Practical matters Overview Linear algebra Derivatives & integrals

or,

$$wv = ||w|| ||v|| \cos \alpha$$

- The dot product of two orthogonal vectors is 0
- $ww = ||w||^2$
- Dot product may be used as a similarity measure between two vectors

Cosine similarity

• The cosine of the angle between two vectors

$$\cos\alpha = \frac{vw}{\|v\|\|w\|}$$

is often used as another similarity metric, called cosine similarity

- The cosine similarity is related to the dot product, but ignores the magnitudes of the vectors
- For unit vectors (vectors of length 1) cosine similarity is equal to the dot product
- $\bullet\,$  The cosine similarity is bounded in range [-1,+1]

Transpose of a  $n \times m$  matrix is an  $m \times n$  matrix whose rows are

 $\text{If } \mathbf{A} = \begin{bmatrix} a & b \\ c & d \\ e & f \end{bmatrix}, \mathbf{A}^\mathsf{T} = \begin{bmatrix} a & c & e \\ b & d & f \end{bmatrix}.$ 

## **Matrices**

 $A = \begin{bmatrix} \alpha_{1,1} & \alpha_{1,2} & \alpha_{1,3} & \dots & \alpha_{1,m} \\ \alpha_{2,1} & \alpha_{2,2} & \alpha_{2,3} & \dots & \alpha_{2,m} \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ \alpha_{n,1} & \alpha_{n,2} & \alpha_{n,3} & \dots & \alpha_{n,m} \end{bmatrix}$ 

- We can think of matrices as collection of row or column vectors
- A matrix with n rows and m columns is in  $\mathbb{R}^{n\times m}$

Practical matters Overview Linear algebra Derivatives & integrals Summary

Similar to vectors, each element is multiplied by the scalar.

 $2\begin{bmatrix} 2 & 1 \\ 1 & 4 \end{bmatrix} = \begin{bmatrix} 2 \times 2 & 2 \times 1 \\ 2 \times 1 & 2 \times 4 \end{bmatrix} = \begin{bmatrix} 4 & 2 \\ 2 & 8 \end{bmatrix}$ 

Multiplying a matrix with a scalar

- Most operations in linear algebra also generalize to more than 2-D objects
- A tensor can be thought of a generalization of vectors and matrices to multiple dimensions

Transpose of a matrix

Practical matters Overview Linear algebra Derivatives & integrals Summary

## Matrix addition and subtraction

the columns of the original matrix. Transpose of a matrix  $\mathbf{A}$  is denoted with  $\mathbf{A}^{\mathsf{T}}$ .

Each element is added to (or subtracted from) the corresponding element

$$\begin{bmatrix} 2 & 1 \\ 1 & 4 \end{bmatrix} + \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix} = \begin{bmatrix} 2 & 2 \\ 2 & 4 \end{bmatrix}$$

### Note:

· Matrix addition and subtraction are defined on matrices of the same dimension

Practical matters Overview Linear algebra Derivatives & integrals Summary

 $\begin{pmatrix} a_{11} & a_{12} & \dots & a_{1k} \\ a_{21} & a_{22} & \dots & a_{2k} \\ \vdots & \vdots & \ddots & \vdots \\ a_{n1} & a_{n2} & \dots & a_{nk} \end{pmatrix} \times \begin{pmatrix} b_{11} & b_{12} & \dots & b_{1m} \\ b_{21} & b_{22} & \dots & b_{2m} \\ \vdots & \vdots & \ddots & \vdots \\ b_{k1} & b_{k2} & \dots & b_{km} \end{pmatrix}$ 

 $c_{ij} = a_{i1}b_{1j} + a_{i2}b_{2j} + \dots a_{ik}b_{kj}$ 

 $= \begin{pmatrix} c_{11} & c_{12} & \dots & c_{1m} \\ c_{21} & c_{22} & \dots & c_{2m} \\ \vdots & \vdots & \ddots & \vdots \\ c_{n1} & c_{n2} & \dots & c_{nm} \end{pmatrix}$

Matrix multiplication

(demonstration)

Practical matters Overview Linear algebra Derivatives & integrals Summary

## Matrix multiplication

- if A is a  $n \times k$  matrix, and B is a  $k \times m$  matrix, their product C is a  $n \times m$  matrix
- Elements of C,  $c_{i,j}$ , are defined as

$$c_{ij} = \sum_{\ell=0}^{k} a_{i\ell} b_{\ell j}$$

• Note:  $c_{i,j}$  is the dot product of the  $i^{th}$  row of  $\boldsymbol{A}$  and the  $j^{th}$ column of B

Ç. Çöltekin, SfS / University of Tübingen

Ç. Çöltekin, SfS / University of Tübinger

Practical matters Overview Linear algebra Derivatives & integrals Summary

## Outer product

The outer product of two column vectors is defined as

$$vw^{\mathsf{T}}$$

$$\begin{bmatrix} 1 \\ 2 \end{bmatrix} \times \begin{bmatrix} 1 & 2 & 3 \end{bmatrix} = \begin{bmatrix} 1 & 2 & 3 \\ 2 & 4 & 6 \end{bmatrix}$$

### Note:

- The result is a matrix
- The vectors do not have to be the same length

Practical matters Overview Linear algebra Derivatives & integrals Summary

## Dot product as matrix multiplication

In machine learning literature, the dot product of two vectors is often written as

$$w^Tv$$

For example, w = (2, 2) and v = (2, -2),

$$\begin{bmatrix} 2 & 2 \end{bmatrix} \times \begin{bmatrix} 2 \\ -2 \end{bmatrix} = 2 \times 2 + 2 \times -2 = 4 - 4 = 0$$

\* This notation is somewhat sloppy, since the result of matrix multiplication is not a scalar

C. Cöltekin. SfS / University of Tübingen

C. Cöltekin, SfS / University of Tübingen

• Multiplying a vector with a matrix transforms the vector • Result is another vector (possibly in a different vector

Many operations on vectors can be expressed with multiplying with a matrix (linear transformations)

Matrix multiplication as transformation

## Identity matrix

• A square matrix in which all the elements of the principal diagonal are ones and all other elements are zeros, is called identity matrix and often denoted I

• Multiplying a matrix with the identity matrix does not change the original matrix

$$IA = A$$

Practical matters Overview Linear algebra Derivatives & integrals Summary

## Transformation examples identity

- · Identity transformation maps a vector to itself
- In two dimensions:

$$\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \times \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} x \\ y \end{bmatrix}$$

Practical matters Overview Linear algebra Derivatives & integrals Summary

# Transformation examples

rotation

$$\begin{bmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{bmatrix}$$

$$\begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix} \times \begin{bmatrix} 1 \\ 2 \end{bmatrix} = \begin{bmatrix} -2 \\ 1 \end{bmatrix}$$

Ç. Çöltekin, SfS / University of Tübingen

# Inverse of a matrix

Inverse of a square matrix W is denoted  $W^{-1}$ , and defined as

$$WW^{-1} = W^{-1}W = I$$

The inverse can be used to solve equation in our previous example:

Practical matters Overview Linear algebra Derivatives & integrals Summary

$$Wx = b$$

$$W^{-1}Wx = W^{-1}b$$

$$Ix = W^{-1}b$$

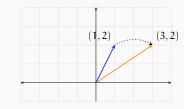

$$x = W^{-1}b$$

Practical matters Overview Linear algebra Derivatives & integrals Summary

# Transformation examples

stretch along the x axis

$$\begin{bmatrix} 3 & 0 \\ 0 & 1 \end{bmatrix} \times \begin{bmatrix} 1 \\ 2 \end{bmatrix} = \begin{bmatrix} 3 \\ 2 \end{bmatrix}$$

Ç. Çöltekin, SfS / University of Tübinger

# Practical matters Overview Linear algebra Derivatives & integrals Sum

# Matrix-vector representation of a set of linear equations

Our earlier example set of linear equations

$$\begin{array}{rcl}
2x_1 & + & x_2 & = & 6 \\
x_1 & + & 4x_2 & = & 17
\end{array}$$

can be written as:

Ç. Çöltekin, SfS / University of Tübingen

C. Cöltekin, SfS / University of Tübingen

$$\underbrace{\begin{bmatrix} 2 & 1 \\ 1 & 4 \end{bmatrix}}_{W} \underbrace{\begin{bmatrix} x_1 \\ x_2 \end{bmatrix}}_{x} = \underbrace{\begin{bmatrix} 6 \\ 17 \end{bmatrix}}_{b}$$

One can solve the above equation using Gaussian elimination (we will not cover it today).

Practical matters Overview Linear algebra Derivatives & integrals Summary

## Determinant of a matrix

$$\begin{vmatrix} a & b \\ c & d \end{vmatrix} = ad - bc$$

The above formula generalizes to higher dimensional matrices through a recursive definition, but you are unlikely to calculate it by hand. Some properties:

- A matrix is invertible if it has a non-zero determinant
- A system of linear equations has a unique solution if the coefficient matrix has a non-zero determinant
- Geometric interpretation of determinant is the (signed) change in the volume of a unit (hyper)cube caused by the transformation defined by the matrix

C. Cöltekin. SfS / University of Tübingen

# Eigenvalues and eigenvectors of a matrix

An eigenvector, v and corresponding eigenvalue,  $\lambda$ , of a matrix Aare defined as

$$Av = \lambda v$$

- Eigenvalues an eigenvectors have many applications from communication theory to quantum mechanics
- A better known example (and close to home) is Google's PageRank algorithm
- We will return to them while discussing PCA and SVD (and maybe more topics/concepts)

C. Cöltekin, SfS / University of Tübinger

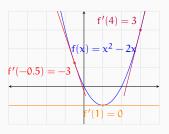

C. Cöltekin, SfS / University of Tübingen

Derivatives

Practical matters Overview Linear algebra Derivatives & integrals Summar

## Finding minima and maxima of a function

- · Many machine learning problems are set up as optimization problems:
  - Define an error function - Finding the paramters minimizing the error
- We search for f'(x) = 0
- The value of f'(x) on other points tell us which direction to go (and how fast)

Ç. Çöltekin, SfS / University of Tübing

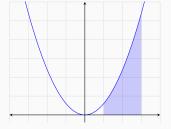

Practical matters Overview Linear algebra Derivatives & integrals Sum

## **Integrals**

- · Integral is the reverse of the derivative (anti-derivative)
- The indefinite integral of f(x) is noted  $F(x) = \int f(x) dx$
- We are often interested in definite integrals

· Integral gives the area under the curve

Ç. Çöltekin, SfS / University of Tübingen

Ç. Çöltekin, SfS / University of Tübinger

Practical matters Overview Linear algebra Derivatives & integrals Summary

## Summary & next week

- Some understanding of linear algebra and calculus is important for understanding many methods in NLP (and ML)
- · See bibliography at the end of the slides if you need a 'more complete' refresher/introduction

Fri Probability theory

Mon Information theory

## • Derivative of a function f(x) is another function f'(x)indicating the rate of change in f(x)

- Alternatively:  $\frac{df}{dx}(x)$ ,  $\frac{df(x)}{dx}$
- Example from physics: velocity is the derivative of the position
- · Our main interest:
  - the points where the derivative is 0 are the stationary points (maxima / minima / saddle points)
  - the derivative evaluated at other points indicate the direction and steepness of the curve

Practical matters Overview Linear algebra Derivatives & integrals Summary

## Partial derivatives and gradient

- In ML, we are often interested in (error) functions of many variables
- A partial derivative is derivative of a multivariate function with respect to a single variable, noted  $\frac{\partial f}{\partial x}$
- A very useful quantity, called gradient, is the vector of partial derivatives with respect to each variable

$$\nabla f(x_1,\dots,x_n) = \left(\frac{\partial f}{\partial x_1},\dots,\frac{\partial f}{\partial x_n}\right)$$

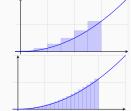

- Gradient points to the direction of the steepest change
- Example: if  $f(x, y) = x^3 + yx$

$$\nabla f(x, y) = (3x^2 + y, x)$$

Ç. Çöltekin, SfS / University of Tübing

# Practical matters Overview Linear algebra Derivatives & integrals Su Numeric integrals & infinite sums

- When integration is not possible with analytic methods, we resort to numeric integration
- · This also shows that integration is 'infinite summation'

# Further reading

- A classic reference book in the field is Strang (2009)
- Shifrin and Adams (2011) and Farin and Hansford (2014) are textbooks with a more practical/graphical orientation.
- Cherney, Denton, and Waldron (2013) and Beezer (2014) are two textbooks that are freely available.
- A well-known (also available online) textbook for calculus is Strang (1991)
